How Does It Work?

Slides are basic HTML.

```html
<div class="deck-container">
  <section class="slide">
    <h1>My Presentation</h1>
  </section>

  <section class="slide">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states

```html
<div class="deck-container">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states
and deck states

```html
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states and deck states, leaving CSS to define what each state look like…

```
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states and deck states, leaving CSS to define what each state look like…

…and how to transition between them.

```html
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states and deck states, leaving CSS to define what each state look like…

…and how to transition between them.

Extensions use core events and methods to add goodies

```html
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states and deck states, leaving CSS to define what each state look like…

…and how to transition between them.

Extensions use core events and methods to add goodies, giving presenters the freedom to add what they want

```html
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```

How Does It Work?

Slides are basic HTML.

The deck.core module keeps track of slide states and deck states, leaving CSS to define what each state look like…

…and how to transition between them.

Extensions use core events and methods to add goodies, giving presenters the freedom to add what they want and leave out what they don't.

```html
<div class="deck-container on-slide-1">
  <section class="slide deck-previous">
    <h1>My Presentation</h1>
  </section>

  <section class="slide deck-current">
    <h2>Slide Header</h2>
    <p>Here is a list of points:</p>
    <ul>
      <li>Point 1</li>
      <li>Point 2</li>
      <li>Point 3</li>
    </ul>
  </section>

  <section class="slide deck-next">
    <h2>Another Slide</h2>
    <blockquote cite="http://example.com">
      <p>Lorem ipsum dolor sit amet.</p>
      <p><cite>Cicero</cite></p>
    </blockquote>
  </section>
</div>
```
